

Gliph Makes Cross-Continental Bitcoin Transfers a Snap

SAN MATEO, CA, August 20th, 2013 – Gliph, a digital identity platform, announced support for peer-to-peer (P2P) Bitcoin payments using the BIPS Bitcoin Wallet.

Gliph's mobile P2P payments feature is a new way to send and receive Bitcoin digital currency. Every Gliph user can now attach a BIPS Bitcoin Wallet to their account then send Bitcoin to other Gliph users via a simple text messaging interface.

“As the largest wallet provider in Europe, BIPS has a variety of international options for funding Bitcoin wallets. Supporting BIPS makes Gliph more useful for swift and low-cost Bitcoin payments between people across the globe,” said Rob Banagale, co-founder and CEO of Gliph.

Gliph debuted support for Bitcoin at the Bitcoin 2013 conference in May, with an industry-leading integration of Coinbase. Since then, Gliph extended its lead by adding Instant Wallet Creation. This unique capability allows people new to Bitcoin to create their wallet while signing up for a Gliph account in just a few taps.

“I’ve been impressed with the ease-of-use Gliph has brought to Bitcoin P2P payments,” said Kris Henriksen, founder and CEO of BIPS. “They’ve taken something with a fairly steep learning curve and made it so anyone can quickly get started using Bitcoin. I was pleased to work directly with Gliph to ensure BIPS works perfectly on their platform.”

Gliph's new release for iOS, Android and the web allows both new and existing users to instantly create their Bitcoin wallet on either Coinbase or BIPS. This multi-wallet capability saves Gliph users the hassle of managing and verifying wallet addresses when sending Bitcoin between Coinbase and BIPS.

“BIPS continues to be the largest provider of Bitcoin merchant services in Europe and hosts well over 10,000 Bitcoin wallets. I’m excited to augment the experience for our users by working with Gliph to provide them the world’s easiest way to send and receive Bitcoin,” added Kris.

“Whether you bank in United States or across the globe, you can now choose a reputable wallet provider, acquire Bitcoin and then get the same secure, private and fun experience of sending Bitcoin using Gliph messaging,” added Rob. “This is another step in the right direction for trusted P2P transactions on the Gliph platform.”

###

About Gliph

Gliph is an identity platform for secure and private communication and transactions. Gliph allows simple Bitcoin transfers directly in-line with secure text messaging. Gliph is available for free on the Apple App Store (<https://gli.ph/iphone>); Google Play (<https://gli.ph/android>); and as a web application (<https://gli.ph/m>). For more information, visit <https://gli.ph>. For more information about Boost VC visit <http://boost.vc>.
